

Low Encoding Overhead Ultra Low Latency Streaming via HESP Through Sparse Initialization Streams

Pieter-Jan Speelmans
CTO

MHV'22, Mar. 1-3, 2022, Denver, CO, USA

Background on the High Efficiency Streaming Protocol

Sub-second latency

- Near real-time interactivity
- In-sync delivery across devices
- Interactive user experiences

Up to 20% reduction in bandwidth & costs

- Cost savings for content distributors
- Re-invest bandwidth savings in higher quality media delivery

Scales over existing infrastructure

- Efficient delivery over existing HTTP infrastructure & CDNs
- CMAF compatible with standard encoders
- Cross platform playback

Enhanced viewer experience

- Instant zapping and seeking times
- Full adaptive bitrate to respond to varying network conditions

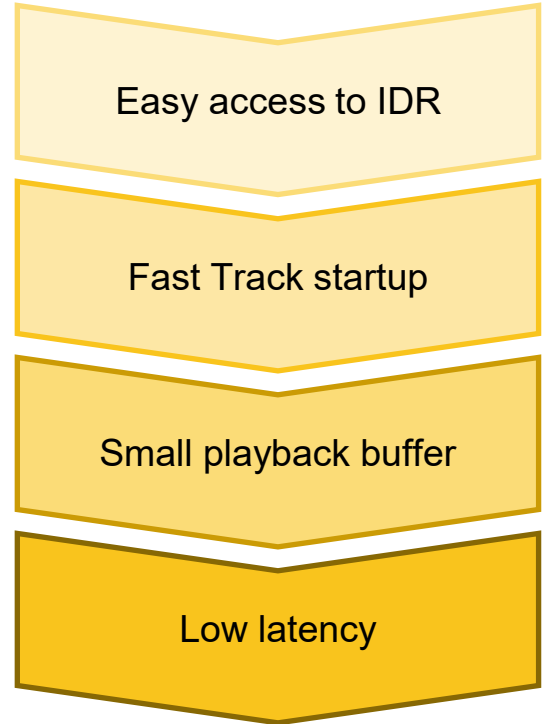

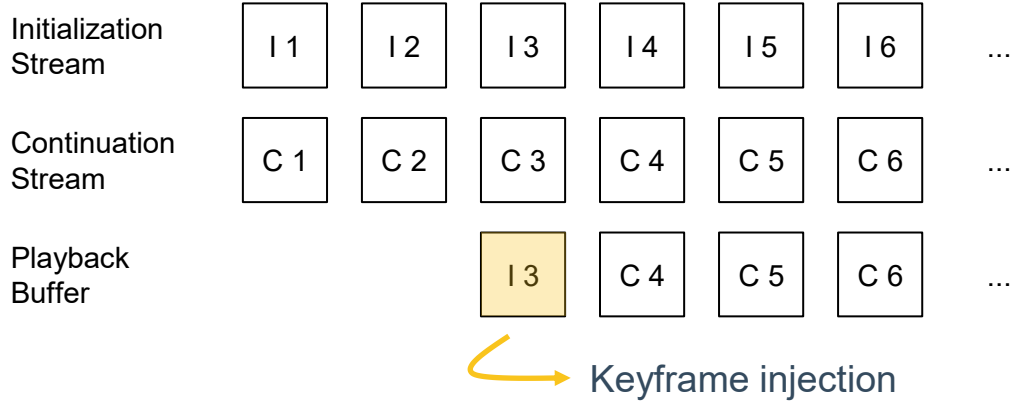

MINIMALISTIC MANIFEST

HTTP DELIVERY

TWO COMPLEMENTARY STREAMS

- Manifest is not needed to start playing the stream.
- Low frequency updates
- HTTP/1.1 based (HTTP/1.1 CTE & Open-Ended Range Requests)
- HTTP/2 & HTTP/3 (QUIC) frame based streaming
- Initialization Stream: can request images at any moment to start playback
- Continuation Stream: can continue playback after an Initialization Stream image

HESP Initialization Streams

Sparse Initialization Streams

A Sparse Initialization Stream is an Initialization Stream which is generated at a frame rate lower than the frame rate of the Continuation Stream.

Sparse Initialization Streams

| Track id | Bitrate | Resolution | Frame Rate |
|----------|-----------|-------------|------------|
| 1080p | 4000 kbps | 1920 x 1080 | 30 fps |
| 720p | 2500 kbps | 1280 x 720 | 30 fps |
| 540p | 1000 kbps | 960 x 540 | 30 fps |
| 360p | 400 kbps | 640 x 360 | 30 fps |

} 4 Tracks (bitrates)

Figure 2: Overview of Continuation Stream encoding profiles

| Scenario | Initialization Stream profile | | | |
|----------|-------------------------------|--------|--------|--------|
| | 1080p | 720p | 540p | 360p |
| 1 | - | - | - | - |
| 2 | 30 fps | 30 fps | 30 fps | 30 fps |
| 3 | - | 30 fps | 30 fps | 30 fps |
| 4 | - | - | 30 fps | 30 fps |
| 5 | - | - | - | 30 fps |
| 6 | 10 fps | 10 fps | 10 fps | 30 fps |
| 7 | 5 fps | 5 fps | 5 fps | 30 fps |
| 8 | 2 fps | 2 fps | 2 fps | 30 fps |
| 9 | 1 fps | 1 fps | 1 fps | 30 fps |
| 10 | 1 fps | 30 fps | 1 fps | 30 fps |
| 11 | 1 fps | 1 fps | 30 fps | 30 fps |

→ DASH reference

 } Mixed configurations

Figure 3: Overview of test scenarios and their Initialization Stream profiles

Impact on encoding

| Scenario | Initialization Stream profile | | | |
|----------|-------------------------------|--------|--------|--------|
| | 1080p | 720p | 540p | 360p |
| 1 | - | - | - | - |
| 2 | 30 fps | 30 fps | 30 fps | 30 fps |
| 3 | - | 30 fps | 30 fps | 30 fps |
| 4 | - | - | 30 fps | 30 fps |
| 5 | - | - | - | 30 fps |
| 6 | 10 fps | 10 fps | 10 fps | 30 fps |
| 7 | 5 fps | 5 fps | 5 fps | 30 fps |
| 8 | 2 fps | 2 fps | 2 fps | 30 fps |
| 9 | 1 fps | 1 fps | 1 fps | 30 fps |
| 10 | 1 fps | 30 fps | 1 fps | 30 fps |
| 11 | 1 fps | 1 fps | 30 fps | 30 fps |

Figure 3: Overview of test scenarios and their Initialization Stream profiles

| Scenario | Instructions / s | Increase vs Scenario 1 | Decrease vs Scenario 2 |
|----------|------------------|------------------------|------------------------|
| 1 | 7,922,246,220 | - | 40,8 % |
| 2 | 13,380,214,610 | +68,9 % | - |
| 3 | 10,357,872,944 | +30,7 % | 22,6 % |
| 4 | 9,126,113,383 | +15,2 % | 31,8 % |
| 5 | 8,164,052,126 | +3,1 % | 39,0 % |
| 6 | 10,124,430,951 | +27,8 % | 24,3 % |
| 7 | 9,126,385,922 | +15,2 % | 31,8 % |
| 8 | 8,403,728,247 | +6,1 % | 37,2 % |
| 9 | 8,197,873,181 | +3,5 % | 38,7 % |
| 10 | 9,775,632,742 | +23,4 % | 26,9 % |
| 11 | 9,093,934,438 | +14,8 % | 32,0 % |

Impact on startup time

Worst case impact:

- Either additional latency at startup
- Or additional startup time

How much?

Average:
$$\frac{\left(\frac{1}{f_i} - \frac{1}{f_{nominal}}\right)}{2}$$

Worst case:
$$\left(\frac{1}{f_i} - \frac{1}{f_{nominal}}\right)$$

| Scenario | Average start-up time (s) | | | | |
|----------|---------------------------|----------------|----------------|----------------|----------------------------------|
| | 1080p | 720p | 540p | 360p | |
| 1 | 1.452 2.854 | 1.407 2.633 | 1.459 2.810 | 1.384 3.003 | Reference |

Figure 6: Average and maximum start-up time results

Impact on ABR switching speed?

Same as startup time

- Not an issue for switching up
 - Delay in higher quality should not have a significant impact
- BIG issue for switching down:
 - Must have enough buffer to: worst case scenario

Must switch to lower quality with Full Initialization Stream to guarantee latency

| Scenario | Average start-up time (s) | | | | |

Figure 6: Average and maximum start-up time results

Conclusions

1.

Allows for encoding cost close to
MPEG-DASH and HLS

2.

Minimum buffer size can remain
the same: latency is not impacted

3.

Small to no impact on QoE
